

Example files to get you on your way faster

Everything is so easy, but we also decided to provide Example files too to get you on your way faster.

You just need to open the Example FLA file (it also includes comments) and you will see how to use the source codes and how to work with them.

NOTE: to compile the example files successfully, please copy the source code AS files at “**Src**” directory to your class paths directory.

NOTE: to compile the **example_TextArea** sample FLA file successfully, please install the fonts used in it on your operating system. You can find the fonts at “**Example\example_TextArea\assets\fonts**” directory.
